

CONTENTS

1. INTRODUCTION	9
2. SCOPE	10
3. GENERAL METHODS USED IN SEISMIC ANALYSIS	11
3.1. Introduction — Free field motion definition	11
3.2. Structural response calculation	12
3.2.1. Modal method	13
3.2.2. Time history analysis	14
3.2.3. Improved methods — stochastic seismic analysis	16
3.2.3.1. Improvement of the quadratic combination law	16
3.2.3.2. Direct calculation of floor spectra	20
3.3. The different steps of a seismic analysis	22
3.3.1. Soil–foundation interaction	23
3.3.1.1. General formulation	23
3.3.1.2. “Shaking table” method	24
3.3.1.3. “Soil impedance” method	25
3.3.2. System–subsystem interaction	26
3.3.3. Multisupported structure calculation	27
3.3.4. Comments on the non-linear aspects of seismic analysis	28
References	32
4. SPECIFIC METHODS USED FOR LMFBR SEISMIC ANALYSIS	35
4.1. Reactor block structures	35
4.1.1. Axisymmetric fluid–structure interaction	35
4.1.2. 3-dimensional effects	41
4.1.2.1. Description using a substructuring technique	42
4.1.2.2. Fluid communication effect	46
4.1.2.3. Shell geometrical imperfections	49
4.1.3. Sloshing effects	50
4.1.4. Buckling analysis	51
4.1.4.1. Background	51
4.1.4.2. Classical static buckling	53
4.1.4.3. Importance of defects	54
4.1.4.4. Dynamic buckling	55
4.1.4.5. Conclusion	58
4.1.5. Isolation device effects	59
4.2. Core analysis	59
4.2.1. Non-linear behaviour of core structures	59
4.2.2. Fluid–structure interaction	63
4.2.2.1. Local aspect	63
4.2.2.2. Global effect — homogenisation techniques	68
4.2.3. Equivalent linear model	71

4.3.	Seismic analysis of major LMFBR components	74
4.3.1.	Control rods and drive mechanisms	74
4.3.2.	Piping systems	77
4.3.3.	Sodium pumps	78
	References	78
5.	IMPACT ON THE DESIGN AND NEEDS FOR TECHNOLOGY IMPROVEMENT ...	85
5.1.	Problems of the fast reactor seismic design	85
5.2.	Need for research and development	85
5.3.	Seismic design of the existing reactors	86
5.4.	Impact of the seismic conditions on designs and projects in the past	86
5.5.	The key point of cost reduction for future plants	88
5.6.	Safety improvement and cost reduction through further R&D	89
5.7.	Design earthquakes	90
5.7.1.	General need for a rationalization of the seismic input	90
5.7.2.	Need for more rational OBE criteria	91
5.7.3.	Need for improved acceleration data	92
5.7.4.	Importance of good knowledge of near-field earthquakes	93
5.8.	Effects of seismic analyses on the reactor building design	93
5.8.1.	Improvement of building structure design	93
5.8.2.	Improvement of soil-structure interaction analysis	94
5.8.3.	Usefulness of on-site tests and detailed analytical methods	95
5.8.4.	Need for new design solutions and siting techniques	95
5.8.4.1.	Embedment	96
5.8.4.2.	Seismic isolation	97
5.8.4.3.	Siting on soft rock sites	100
5.8.4.4.	In-shore siting	100
5.9.	Effect of the seismic loading on the reactor vessel design	101
5.9.1.	Effects of seismic loads on the existing pool-type designs	102
5.9.2.	Effects of seismic loads on the existing loop-type designs	104
5.9.3.	R&D work needed to improve the design	106
5.9.3.1.	Improvement of fluid-structure interaction analysis	106
5.9.3.2.	Improvement of understanding of buckling phenomena	107
5.9.3.3.	Improvement of sloshing analysis	107
5.9.3.4.	Improvement of reactor-block vertical analysis	108
5.9.4.	Development of vessel support concepts	108
5.10.	Impact of the seismic loads on the core design	109
5.10.1.	Core horizontal response	109
5.10.1.1.	Core seismic requirements	110
5.10.1.2.	Core design solutions	110
5.10.1.3.	The PEC case	112
5.10.1.4.	Need for further R&D	113
5.10.2.	Core vertical response	114
5.10.3.	Development of core support structures and arrangements	116

5.11. Impact of the seismic analyses on the shutdown system design	116
5.11.1. Main problems of the analysis	116
5.11.2. Limits of the experimental analysis	120
5.11.3. Usefulness and limits of detailed numerical tools	121
5.11.4. Perspectives of new design solutions	122
5.12. Impact of the seismic loads on the piping design	123
5.12.1. Problems and possible design improvements	123
5.12.2. Damping data	124
5.12.3. Use of strain limits	125
5.12.4. Improvement of analytical methods	125
5.12.5. Development of expansion joints	126
5.12.6. Need for further tests	126
5.13. Impact of seismic analyses on the design of other components and equipments	127
5.13.1. Effects on the existing designs and projects	127
5.13.2. Need for further work	128
5.13.2.1. Improvements for pump dynamic analysis	128
5.13.2.2. Development of systems reducing component seismic response	128
5.14. Usefulness of advanced seismic monitoring systems	130
References	132
6. EXPERIMENTAL ANALYSIS	138
6.1. Introductory remarks	138
6.2. Seismic test procedures and experimental devices	139
6.2.1. Types of test procedures	139
6.2.2. Excitation techniques	139
6.2.2.1. Tests on shaking table	142
6.2.2.2. Tests with concentrated excitation	142
6.2.2.3. On-site test techniques	143
6.3. Scale models and examples of mock-up tests	144
6.3.1. Full-scale mock-ups	144
6.3.2. Assessment of reduced-scale mock-ups	145
6.3.2.1. Need for scale reduction	145
6.3.2.2. Comments on the similitude laws	145
6.3.2.3. Similitude laws for the structure	147
6.3.2.4. Similitude laws for the fluid	148
6.3.3. Examples of core tests using element mock-ups in full scale	149
6.3.3.1. Need for the core full-scale tests	149
6.3.3.2. Core tests performed for PEC	150
6.3.3.3. Core tests performed for SUPERPHENIX-1	152
6.3.3.4. Core tests performed for MONJU	153
6.3.4. Examples of full-scale mock-up tests of shutdown systems	155
6.3.4.1. Need for the shutdown system full-scale tests	155
6.3.4.2. Shutdown system tests performed for SUPERPHENIX-1	155

6.3.4.3.	Shutdown system tests performed for PEC	157
6.3.4.4.	Shutdown system tests performed for MONJU	159
6.3.4.5.	Tests performed for the ASD system of CDFR	162
6.3.5.	Tests in sodium on the SUPERPHENIX-1 primary pump bearing	162
6.3.6.	Tests on a whole core in reduced scale (Rapsodie mock-up)	163
6.3.7.	Sloshing analysis on a MONJU reactor-block mock-up in reduced scale	167
6.4.	Instrumentation	170
6.5.	Excitation types	172
6.6.	Data treatment	173
6.7.	Seismic qualification of equipments	173
6.8.	On-site analysis	174
6.8.1.	On-site experience for fast reactors	174
6.8.2.	On-site experience for thermal reactors	175
6.8.3.	On-site tests performed on the PEC fast reactor	177
6.8.3.1.	Building tests	177
6.8.3.2.	Main vessel tests	179
