Women and Girls in Science

Did you know?

Only 30% of the world’s scientists and researchers are women.

The IAEA actively supports the advancement of women in nuclear science. Its technical cooperation programme supports hundreds of female scientists each year, providing specialist training (fellowships) and scientific visits.

Fellowships are normally provided to meet the needs of specific technical cooperation projects. They are available to university graduates and young professionals and can be awarded for periods of up to a year. Scientific visits are of a shorter duration, and target established professionals.

IAEA fellowships

The First Woman Fellow: A chemical sciences researcher from Thailand was awarded a one-year fellowship in January 1959.

Since then, the participation of women in IAEA fellowships and scientific visits has grown each decade.
