# Disclosures:

Developer of commercial software tools:

By Virtual Phantoms  
<https://www.virtual-dose.com>

DeepViewer

By Wisdom Tech <http://www.wisdom-tech.online/>

# **Learning objectives:**

**1. To gain a historical perspective of computational human phantoms and Monte Carlo dose calculations;**

**2.To learn about the latest research and development on patient-specific phantoms involving automatic multi-organ segmentation tools;**

**3.To learn about the latest research and development on rapid Monte Carlo dose calculation tools involving GPU co-processors as well as virtual-source-modeling of CT and PET/CT scanner, radiotherapy linac, and those found in common radiation protection environments.**

# 60-Year History of Computational Phantoms

- Radiation Protection
- Medical Imaging
- Radiotherapy

IOP Publishing | Institute of Physics and Engineering in Medicine  
Phys. Med. Biol. 59 (2014) R233–R302  
doi:10.1088/0031-9155/59/18/R233

2000s-present

- Personalization
- Multi-scale  
(voxel – DNA)

# Comments

- For decades, in imaging procedures, all “organ doses” were assessed using ICRP “Reference Man” approach involving “population-averaged phantom libraries”
- “Patient-specific organ doses” would require two newly available tools:
  1. automatic organ segmentation
  2. “near real-time” Monte Carlo simulations

# Outline of the presentation

# 1st-Generation “Stylized” Phantoms

(Society of Nuclear Medicine’s MIRD Committee)

- ICRP paradigm based on “population averaged” Reference Man concept
- Anatomically simple and friendly for computers prior to 1980s

Snyder *et al* (1978), Cristy (1980), and Cristy and Eckerman (1987), plus ADAM/Eva phantoms by Kramer *et al* (1982) from Germany

At the end of each trimester of pregnancy  
(Stabin *et al* 1995)

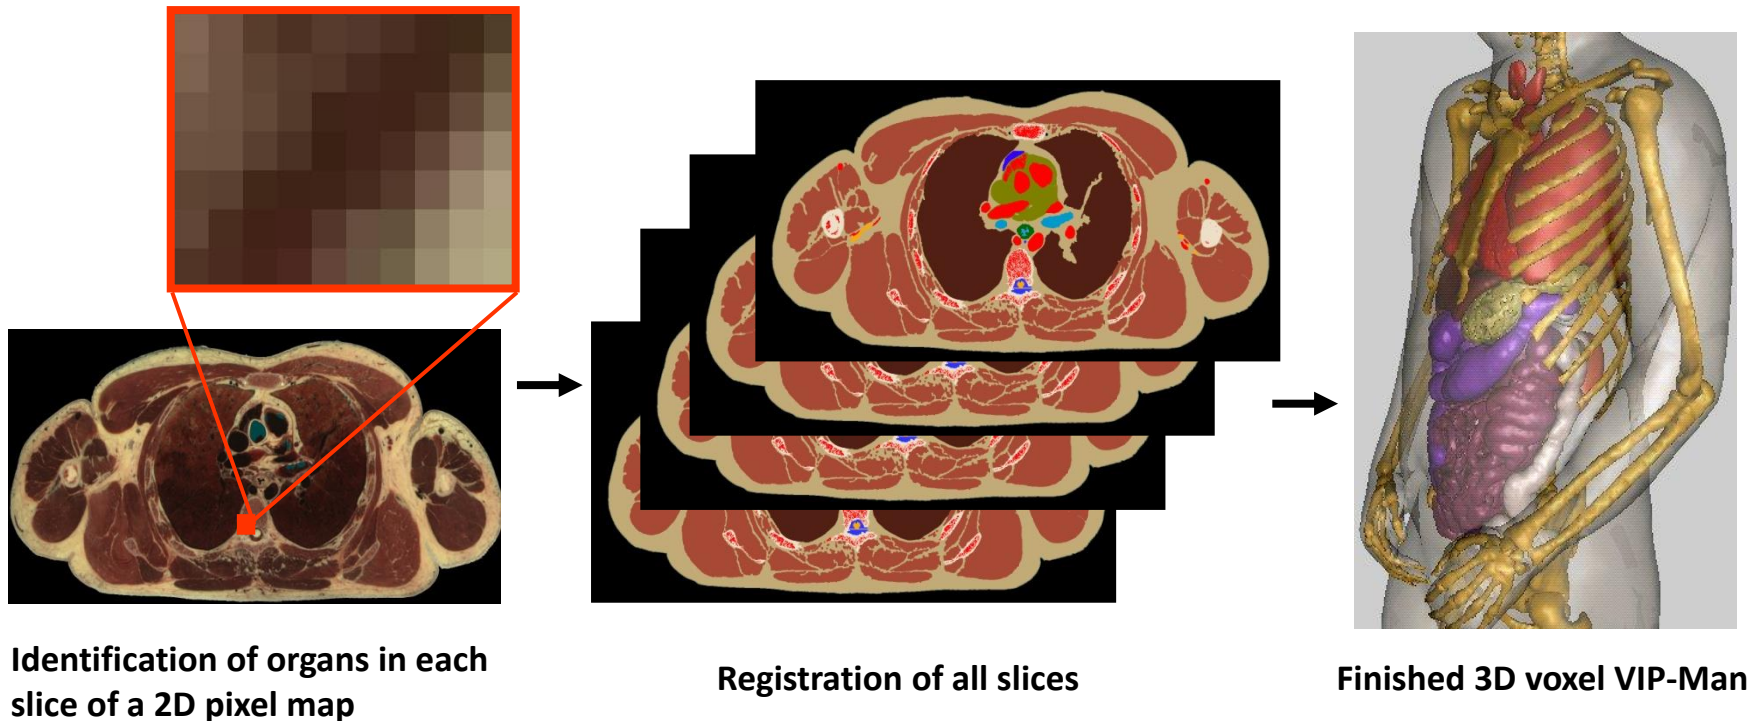

- The Computational Anatomical Man (CAM) and
- CAF (Computerized Anatomical Female)
- by Billings and Yucker (1973)
- Used exclusively by NASA

## 2<sup>nd</sup>-Generation “Voxel” Phantoms - Example of the VIP-Man (1997-2000)

Xu XG, Chao TC, Bozkurt A. VIP-Man: An image-based whole-body adult male model constructed from color photographs of the Visible Human Project for multi-particle Monte Carlo calculations. Health Phys., 78(5):476-486, 2000. *One of the most cited (450+)*

# Monte Carlo Methods Ideal for Radiation Transport Simulations, but Used to be Extremely Slow

Boltzmann Transport Equation can be solved by MC methods

$$\frac{1}{v} \frac{\partial}{\partial t} \psi(\vec{r}, \hat{\Omega}, E, t) + \hat{\Omega} \cdot \vec{\nabla} \psi(\vec{r}, \hat{\Omega}, E, t) + \Sigma_t(\vec{r}, E) \psi(\vec{r}, \hat{\Omega}, E, t) \\ = \int dE' \int d\Omega' \Sigma_s(\vec{r}, E' \rightarrow E, \hat{\Omega}' \cdot \hat{\Omega}) \psi(\vec{r}, \hat{\Omega}', E', t) + S(\vec{r}, \hat{\Omega}, E, t)$$

A Statistical Experiment

# Introduction: Dose Calculation and Monte Carlo Methods

- Dose: energy imparted to matter via ionization and excitation per unit mass
- Deterministic methods subject to non-trivial errors by approximating electron transport in water
- Monte Carlo particle transport is the **gold standard**
- But lengthy computation time is the main bottleneck of MC applications for clinical settings

# The ARCHER Project

- ARCHER (Accelerated Radiation-transport Computations in Heterogeneous EnviRonments)
  - **Initiated in 2009**
  - **Goals:**
    1. To understand heterogeneous computing architecture and programming models
    2. To test code performance on GPUs and MICs
    3. To develop functional Monte Carlo codes that take full advantage of CPUs, GPUs and MICs

# Solution: ARCHER – A GPU-based Monte Carlo Code

## POINT/COUNTERPOINT

*Suggestions for topics suitable for these Point/Counterpoint debates should be addressed to Collin G. Orton, Professor Emeritus, Wayne State University. E-mail: orcion@comcast.net. Persons participating in Point/Counterpoint discussions are selected for their knowledge and communicative skill. Their positions for or against a proposition may or may not reflect their personal opinions or the positions of their employers.*

## GPU technology is the hope for near real-time Monte Carlo dose calculations

# Real-time MC?

### OVERVIEW

Monte Carlo (MC) dose calculations are recognized as being the most accurate modality for radiotherapy treatment planning but, because of the excessive computational time required, they cannot presently be used for near real-time dose calculations. Currently, the most common way to accelerate MC dose calculations is to use clusters of central processing units (CPUs), but some believe that the future of near real-time MC dose calculations lies not with clusters of CPUs but with the use of graphics processing unit (GPU) technology. This is the claim debated in this month's Point/Counterpoint.

Arguing for the Proposition is Xun Jia, Ph.D. Dr. Jia received his Masters degree in Applied Mathematics and Ph.D. degree in Physics, both from UCLA. He is currently an Assistant Professor in the Department of Radiation Oncology, University of Texas Southwestern Medical Center. Dr. Jia's research focuses on GPU-based high-performance computing for medical physics and medical imaging. He has developed several Monte Carlo packages to improve efficiency for photon, electron, and proton transport. Dr. Jia's research has been supported by government and industrial grants and he has published 60 peer-reviewed papers. He is currently a section editor of the *Journal of Applied Clinical Medical Physics*.

Arguing against the Proposition is X. George Xu, Ph.D. Dr. Xu obtained his Ph.D. in Nuclear Engineering from Texas A&M University, College Station, TX and, for the past 20 years, he has been on the faculty of Rensselaer Polytechnic Institute, Troy, NY, where he currently holds the Edward E. Hood Endowed Chair of Engineering. Dr. Xu's research has centered around applications of Monte Carlo methods to problems in radiation protection, imaging, and radiation therapy. He has been continuously funded by the NIH over the past ten years, including an R01 grant to develop a new Monte Carlo code, ARCHER, for heterogeneous computing involving GPUs and coprocessors. He is the author of more than 150 journal papers and book chapters, and 270 conference abstracts. Dr. Xu is a Fellow of the American Association of Physicists in Medicine, the Health Physics Society, and the American Nuclear Society. In 2014, he was re-elected to a 6-yr term as a council member of the National Council on Radiation Protection and Measurements.

**FOR THE PROPOSITION: Xun Jia, Ph.D.**  
Opening Statement

Clinical applications of MC dose calculations have been limited by the long computation time to achieve a sufficient precision level. Over the years, great efforts have been devoted

## GPU is more powerful than CPU

### Application

- CT imaging
- Radiotherapy
- Shielding design
- Reactor analysis

### ARCHER

### Hardware

- Intel/AMD multi-core CPU
- NVIDIA Fermi/Kepler GPU
- AMD GCN GPU
- Intel MIC coprocessor

### Software

- MPI
- OpenMP
- Pthreads
- CUDA
- OpenACC
- OpenCL
- Cilk

# Desk-Top CPU/GPU Hardware @ \$10k

**NVIDIA®**

Multiple Nvidia GPU cards

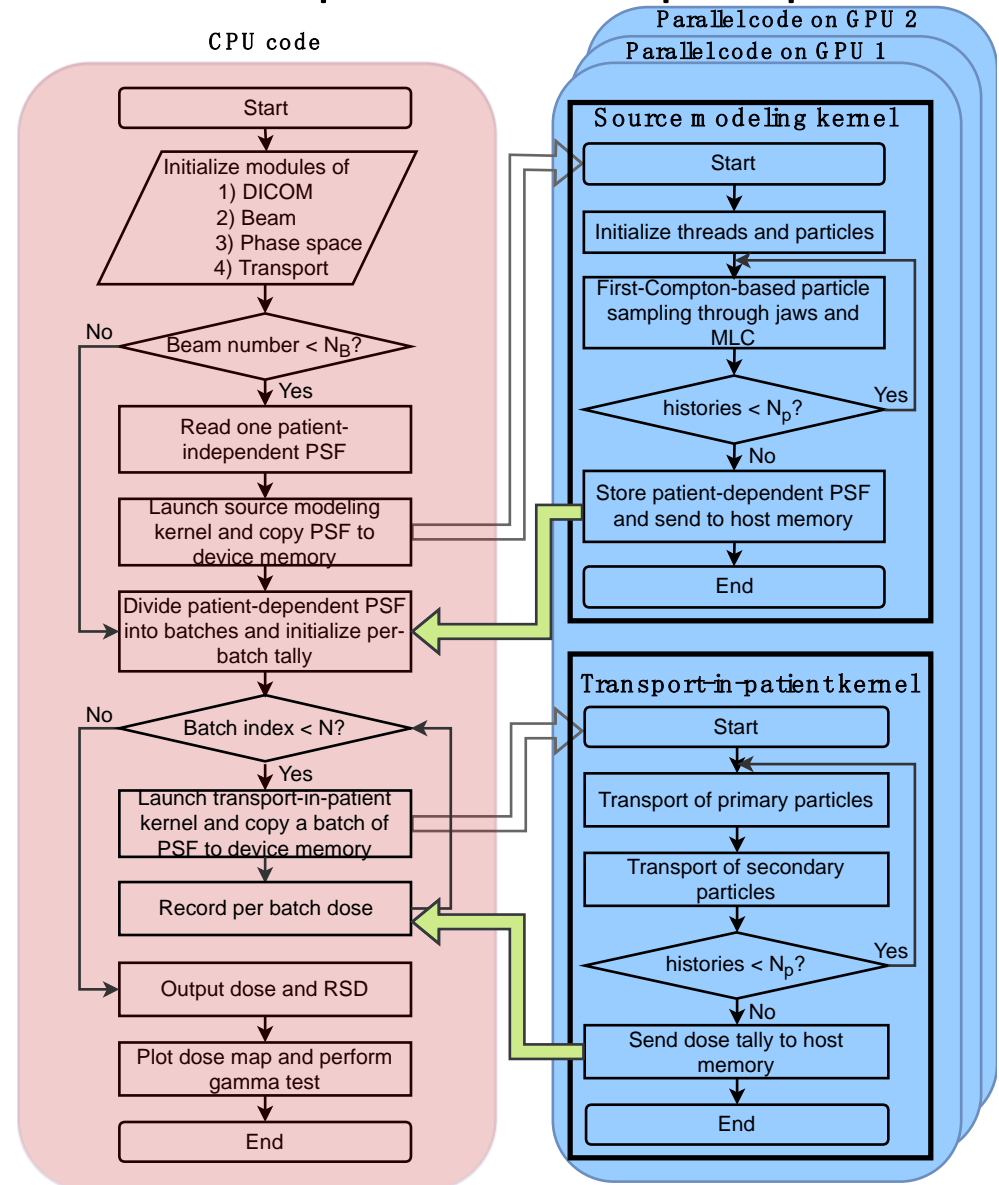

Intel CPU

# ARCHER Software Development

- Workflow of synchronized source model-particle transport process

- Two code variants
- ARCHER<sub>CPU</sub>: supports multi-threaded parallelization
- ARCHER<sub>GPU</sub>: supports multi-GPUs parallelization

# Introduction: External-Beam Radiotherapy

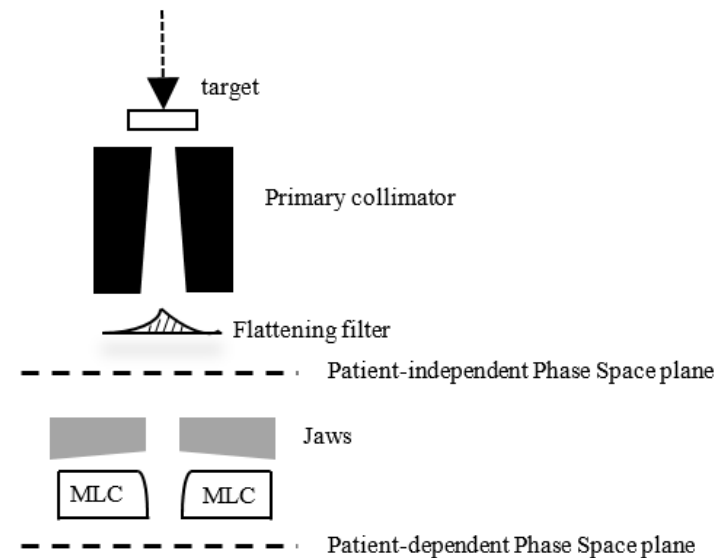

- 1.7 million new cancer cases in the U.S in 2017<sup>[1]</sup>
- 52% cancer patients receive external photon beam radiotherapy
- Radiation Therapy aims to maximize the dose to the tumor, while minimizing the dose to adjacent healthy tissues

- The accuracy of dose calculations is crucial to treatment planning and dose delivery
  - Accuracy of the source term modeling
  - Accuracy of the dose calculation methods

[1] Siegel, R., K.D. Miller, and A. Jemal. CA Cancer J Clin 67 (2017): 7-30.

# Virtual Source Modeling

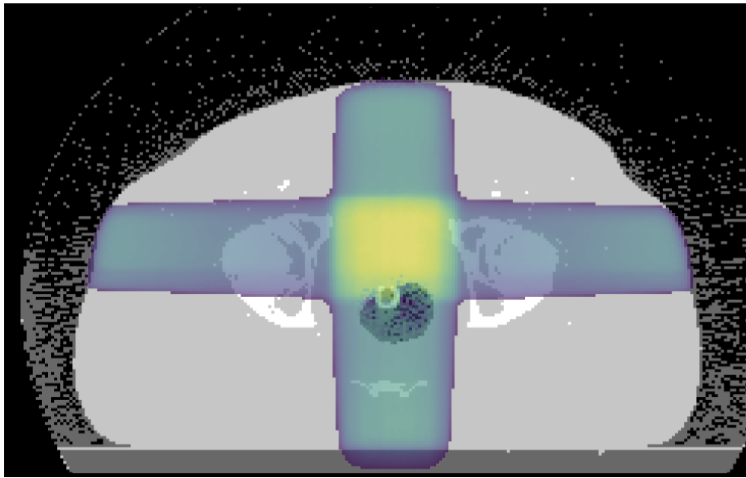

- Phase space source

- Phase space particles: a collection of representative pseudo-particles emerging from a radiotherapy source along with their properties ( $x, y, z, u, v, w, E, wt$ )
- can be categorized as
  - Patient-independent phase space: could be utilized repeatedly
  - Patient-dependent phase space: specific to each plan and beam

# Results: ARCHER for External-Beam Therapy (Tomotherapy, IMRT and VMAT) [1-5]

## Step and Shoot IMRT

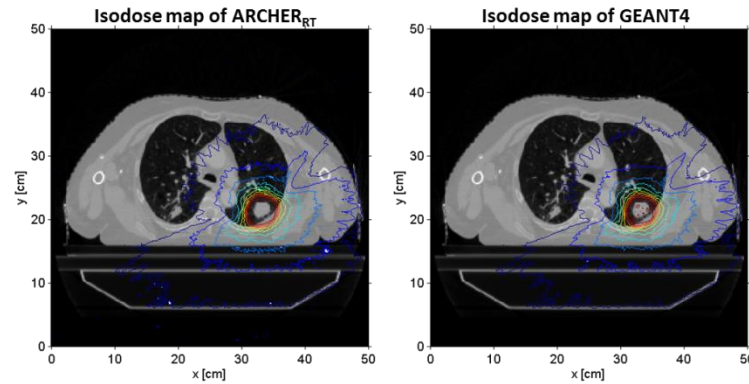

## VMAT

# Results: Tomotherapy

Su L, Yang YM, Bednarz, Edmond Sterpin, Du X, Liu T, Ji W, Xu XG. ARCHERRT — A Photon-Electron Coupled Monte Carlo Dose Computing Engine for GPU: Software Development of and Application to Helical Tomotherapy. Med Phys (2014).

Statistical error in PTV ~1%

2%/2mm Gamma test pass rate: 98.5%

***GPU computing time ~ 1 sec,  
reducing from GEANT4 ~ 500  
CPU hours***

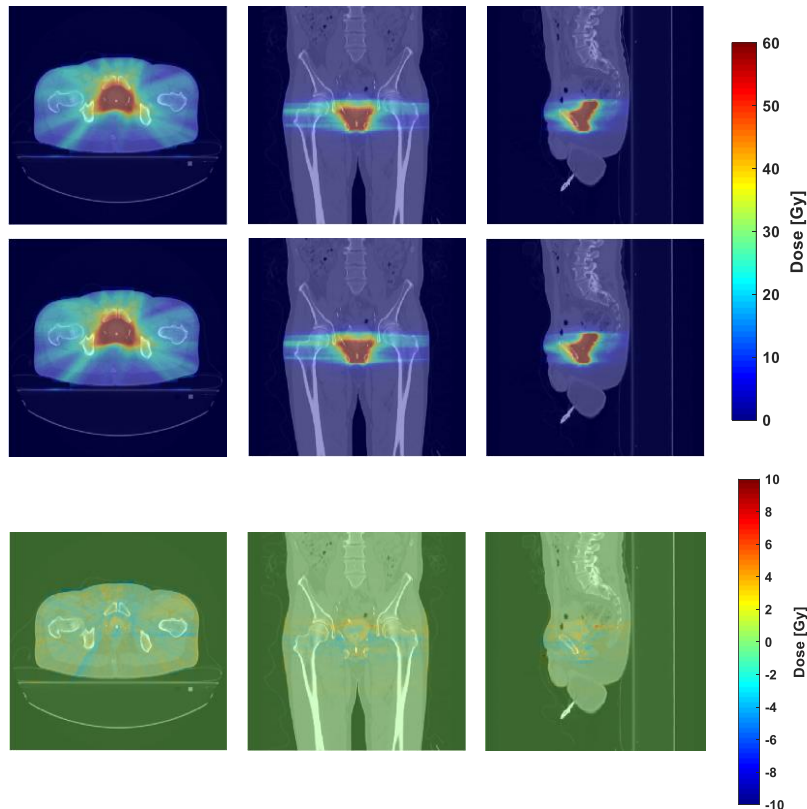

# Results: Clinical VMAT (prostate case)

ARCHER

EGSnrc

EGSnrc -  
ARCHER

- Gamma pass rates:
  - 3%/3mm: 99.71%

**ARCHER (NVIDIA 1080Ti GPU) ➡ 48 seconds**

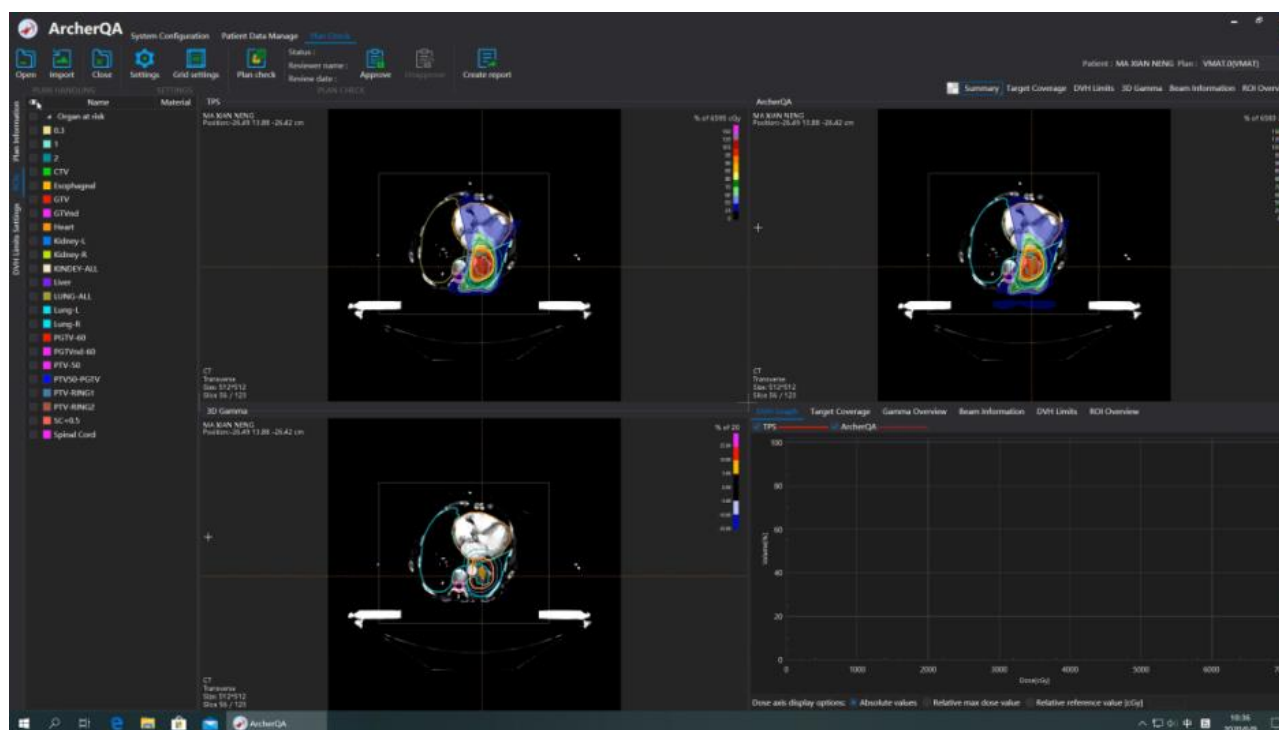

- Patient transport
- Source modeling (linac)

**EGSnrc (120-node cluster Intel Xeon E5335 CPUs) ➡ 24 hours**

# Software Tool for 3D Independent Dose-check (verification of TPS results)

## ArcherQA

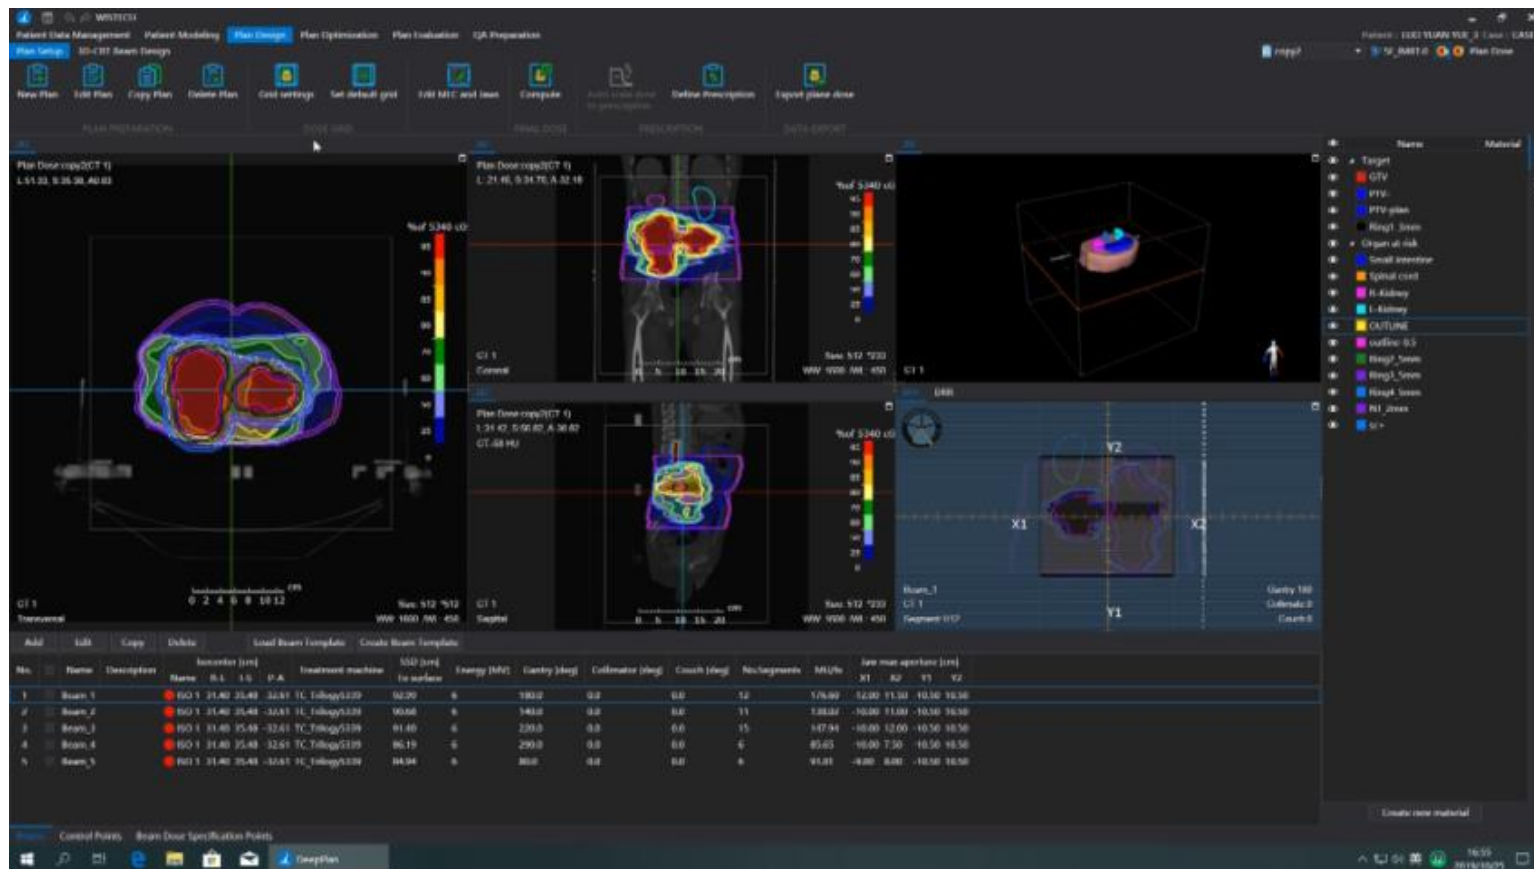

1. GPU-accelerated Monte Carlo dose engine
2. Data analyze tools, such as 2D and 3D Gamma Test and DVHs
3. TPS and Machine Check
4. Friendly user interfaces, easy to commission and setup

Archer QA GUI

# Treatment Planning System (TPS), DeepPlan

- Photons, electrons, protons
- Different dose algorithms including GPU-based Monte Carlo
- Integrated with auto contouring and registration

# Summary

1. Personalized patient organ-dose always needed for radiation treatment planning
2. The workflow greatly facilitated by:
  - ✓ AI –based automatic segmentation tools are well tested
  - ✓ Real-time MC computing provides RT QA solutions
3. A paradigm change from “population averaged” Reference Man to “personalized organ doses” is feasible
